                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human nucleic acids (hA157798-AA15:359) and the encoded polypeptides (hAM38642-AAM42213) with nootropic. Immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropath; and localised neuropathies and central nervous system disease, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic assays for receptor activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and C. The present invention describes primer sets for synthesising 5602 cc full-length cDNAs defined in the specification. Where a primer set cc comprises: (a) an oligorod primer and an oligonucleotide complementary strand of a polynucleotide witch comprises one of the 5602 nucleotide sequences defined in the specification, where the cc cligonucleotide comprises at least 15 nucleotides; or (b) a combination of an oligonucleotide comprising a sequence complementary to the ccmplementary strand of a polynucleotide which comprises a 5'-end sequence and an oligonucleotide comprising a sequence complementary to a polynucleotide which comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides in gene therapy and sequence is selected from those defined in the specification. The primers are useful for synthesising polynucleotides. The primers are useful for synthesising polynucleotides in gene therapy and complementary to a sequence is selected from those defined in the specification and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs. The primers are also useful for the full-length cDNAs. The primers allow obtaining of the full-length cDNAs are also useful for the thing and the sequences of the full-length cDNAs are sequences; and AAH13628 and AAH13633 to AAH13629 to AAH13632 represent human cDNA sequences; and AAH13629 to AAH13632 of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer sets for synthesizing polynucleotides, particularly the 5502 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         WPI:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ota I.

The polypurcleotides are useful in gene therapy. A composition containing a polypeptide or polypurcleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as alzheiner's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression. Activinyinhibin activity, chemotactic/chemokinetic activity, haerostatic assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation.

The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenca. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                  25-FEB-2000:

The cDNA encodes a protein that includes 2 insert sequences not found in other CPSII proteins. The first separates the putative structural subdomain and the glutaminase subdomain of the glutamine-amidotransferase subunit of CPSII, while the second separates 2 ATP binding subdomains of the

In the SRPK1 DIA sequence, the sequence preceding the ATG initiation condon contains stop codons in all three reading frames. The sequence surrounding the initiation codon conforms to the Kozak consensus sequence. SRPK1 acts to phosphorylate serine residues of the SR domain of the SR family of splicing factors. The phosphorylation of these sites by SRPK1 affects the ability of the splicing factors to mediate pre-mRNA splicing and regulates the cellular distribution of splicing factors splicing and regulates the cellular distribution of splicing factors during the cell cycle. SRPK1 has a mol. wt. of 92 kb as determined by SDS-PAGE. The modulation of SRPK1 activity can be used to treat by Ungarits, Behcet's syndrome, acute respiratory distress syndrome, cull proliferative disorders, e.g. malignancies, psoriasis, pemphigus vulgarits, Behcet's syndrome, acute respiratory distress syndrome, leukaemia, rheumatoid arthritis, AIDS, vasculitis, septic shock and other types of acute inflammation, and lipid histiocytosis. The sequence given in fig. 2 is longer than the sequence given in the

```

The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which use at least one polypeptide or polynucleotide sequence belonging to the perlecan, precursor of the retinol-binding plasma protein, precursor of the retinol-binding plasma protein, precursor of the state of the californial protein families. The method is used for detecting, preventing or treating a degenerative, neurological and/or auto-immune disease. The polynucleotides and polypeptides are used for diagnosis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and

uses of.

The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against porphorymonas gingivalis. Probes can be used to detect porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodomical section.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agius CI,

                                                                                                                                                                                                                                                                                                                                                                      AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease especially gingivitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    10-DEC-1998;

The computer searches the database based on a query formulated from the motif to obtain a set of polypeptide sequences which are then filtered and a report of the filtered set of polypeptide sequence information is then displayed. The computer system is useful for identifying recombinant C.elegans p95.5/NN52 and other mitochondrial proteins involved in binding, transport or other regulation of intracellular calcium which provides targets for screening assays that identify agents capable of altering a mitochondrial activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed.
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 bas
